AUTHOR: Skazkin, S. D., Academician

TITLE: Soviet-French Conference of Historians (Sovetsko-frantsuzskiy kollokvium istorikov)

PERIODICAL: Vestnik Akademii nauk SSSR, 1959, Nr 3, pp 96-98 (USSR)

ABSTRACT: This Conference of French and Soviet historians was held in Paris from October 21 to 25, 1958 and dealt with the discussion of the following six subjects: serfdom in France and Russia from the eleventh to the sixteenth century; the medieval town; new works and the prospects of further research work on the French Revolution of the eighteenth century; social movements in Russia until 1861; industrial revolutions and economic crises of the nineteenth century; Franco-Russian relations at the end of the nineteenth century. It was agreed that experts of both countries held lectures on each subject which were then discussed. The Soviet delegation was headed by V. P. Volgin and consisted of the following members: A. V. Artsikhovskiy, V. I. Bovykin, A. R. Ioanisian, A. D. Lyublinskaya, A. Z. Manfred, M. V. Nechkina, B. F. Porshnev, S. D. Skazkin and V. I. Shunkov. The meetings usually were attended by 30 to 50 dele-

Soviet-French Conference of Historians

gates. They were characterized by lively discussions due to the different conceptions of the world and the methodological principles. These problems will be discussed at the World Congress of Historians in Stockholm in 1960. In conclusion, the author of this paper states that such meetings of Soviet historians with bourgeois historians promote mutual information and the interest of foreign countries in Russian history.

Gonadotropic activity of the frontal part of hypophysis during arrest of its thyrotropic action. I. A. Eakin and Yu. I. Skebel'skaya. *Doklady Akad. Nauk S.S.S.R.* 63: 213-16(1948).--In expts. with rats which were given dried thyroid tissue for 10-27 days to inhibit the hypophysis function (at 75-100 mg. daily) the wt. of the thyroid gland was reduced from normal and histological examn. showed the glands to be in a state of distinct hypofunction. Tests for the thyrotropic function in the glands (by chick injection) failed to show an increase of the chick thyroid glands, showing a sharply decreased hormone content. The follicle stimulating function, however, is not affected. If the animals are kept near 0°, there is a decrease of uterus wt. as a result of thyroid feeding; at room temp. the effect is absent. Thus, the gonadotropic action of hypophysis is not disturbed by reduced thyrotropic activity. G. M. Kosolapoff

"Investigating the Thyrotropic Activity of the Frontal Part of the Hypophysis While Retarding Its Gonadotropic Function," I. A. Eskin, Yu. B. Skebel'skaya, All-Union Experimental Inst of Endocrinol, Moscow, 4 pp

"Dok Ak Nauk SSSR" Vol LXVI, No 4

Studied dependence of thyrotropic activity of rat hypophysis upon its gonadotropic function. Authors obtained new data strengthening their previous assumption on absence of mutual dependency in implementation of thyrotropic and gonadotropic functions of the hypophysis. Normal gonadotropic activity is retained when thyrotropic function of frontal part of hypophysis is inhibited, and normal thyrotropic activity is retained when gonadotropic function is inhibited. Submitted by Acad A. D. Speranskiy, 4 Apr 49.

Variation of sensitivity of the thyroid to the thyrotropic hormone of the hypophysis under surgical trauma. I. A. Piskin, Yu. B. Skelchayeva, and A. K. Ralskaya. *Dokl. Akad. Nauk S.S.S.R.* 68, 981 (1949). Young chicks injected daily with hypophysis exts. from normal or traumatized (removal of tail, castration, etc.) rats show after 5 days no difference in wt. of the thyroid (both equally above the controls). The known lowering of the thyroid function in the rat after surgical trauma (*Ibid.* 66:7 (1949)) is caused by lowering of sensitivity of the thyroid to the hypophysis hormone. The results are confirmed on chickens with surgical trauma with administration of the hormone. G. M. Kosolapoff

The effect of pharmacodynamic central nervous system stimulating substances on the function of the thyroid gland. Yu. B. Stebel'skaya. *Doklady Akad. Nauk S.S.S.R.* 24, 1273-6 (1957). A study was made of the effect of central nervous stimulation on the thyroid gland as representative of the internal secretion glands. Caffeine and phenamine were used as the pharmacol. agents. Sexually immature male rats weighing 65-65 g. and *Rana temporaria* tadpoles were used as the exptl. animals. Increase in the av. wt. of the thyroid gland, in the height of the follicular epithelium, and in the diam. of the follicles (as detd. by histological methods) were used as result indicators in the case of the rats. The thyroid glands of the exptl. rats were transplanted to tadpoles, and changes in the length of the tadpole intestine were recorded. Such data were regarded as indicators of the effect of the thyroid glands of the exptl. rats on the rate of tadpole metamorphosis. The neurostimulants were fed to the rats twice daily via the milk diet. Doses of caffeine of 50 mg. administered for periods lasting 1-10 days activated the function of the thyroid gland. Increase of the dose to 75-100 mg. and of the duration of administration to 20 days lowered the activity of the thyroid gland. It is supposed that superstimulation of the cortical centers of the brain by caffeine has a beyond-limit arresting and even lowering effect on the functional activity of the thyroid gland. In the case of phenamine, the doses of the drug administered and the duration in days were different, but the exptl. results generally ran parallel to those obtained with caffeine. B. S. Levine

Effect of sodium bromide on the thyroid of white rats.  
 Y. B. Skebel'skaya (All-Union Inst. Exptl. Endocrinol.,  
 Ministry of Health, Moscow). *Doklady Akad. Nauk*  
 S.S.S.R. 94, 166-8 (1954).—Introduction of 10 mg. NaBr  
 daily with food leads to a distinct wt. decline in the thyroid  
 gland of a white rat; along with this effect there occurs a  
 flattening of the epithelial layer indicating a lowering of  
 activity of the gland over a 3-day exptl. period. After 5-10  
 days of such treatment the height of the follicular epithelium  
 exceeds that of controls by some 80%, with corresponding  
 rise in gland activity. At 60-mg. daily dosage the same  
 effects can be seen in 2-5 days. Amytal-sodium at 90-mg.  
 dosage gives similar changes in the thyroid as were ob-  
 served with NaBr administration, indicating that these  
 drugs operate through the medium of the central nervous  
 system. This is supported by stimulus response expts.  
 (sound stimulus) with rats which show different rates of such  
 response in the normal state; the response of the thyroids  
 of such animals to NaBr and caffeine corresponds to the  
 nature of the response to sound stimuli. G. M. Kosolapoff

Title : Cortical Regulation of the Thyrotrophic Function of the Pituitary and the Thyroid Gland.

Orig Pub : Probl. endokrinol. i gormonoterapii, 1955, 1, No 2, 9-15

Abstract : Cortical regulation of the thyrotrophic function of the pituitary in rats was studied by means of conditioned reflexes. Thyroxine and 6-methylthiouracil served as unconditioned stimuli, while the situation and procedure for injecting the preparations were conditioned factors. The unconditioned and conditioned stimuli were combined for a period of 10 days, and then either the thyroxine or the 6-methylthiouracil was replaced with distilled water or physiological solution. The thyrotrophic function of the pituitary was evaluated by the change in weight of the thyroid

- conditioned the same exper-

✓ *med* Influence of adrenocorticotropin (ACTH) on thyroid gland and thyrotropic function of hypophysis. Yu. B. Siskel'nikova (All-Union Inst. Exptl. Endocrinol., Moscow). *Problemy Endokrinol. i Gormonoterap.* 2, No. 6 30-7 (1956). In rats, 1 injection of 10 units of ACTH induced a rapid, but temporary, decrease in activity of thyroid gland which is reflected in lowered capacity to accumulate  $I^{131}$ . Chronic injection of 10 units of ACTH results in morphological evidence of hypofunction of the thyroid, with decrease in weight of the gland and increased packing of follicular epithelial cells. Endogenous ACTH, liberated from hypophysis of rats under the influence of CH<sub>2</sub>O injections, affects the thyroid in the same way as the exogenously administered ACTH. After prolonged administration of ACTH there appears a weakened response of thyroid gland to thyrotropic hormone. J. A. Siskel

2069. POSSIBILITY OF UTILIZATION OF PARAFFIN FRACTION OF SAPHONELIC TAR. - Brakss, H. and Čekle, V. (Latv. PSR Zināt. akad., Ķīm. Inst. Zināt. [Latv. Acad. Sci., Inst. Chem. Sci.], 1950, vol. 1, 127-137; abstr. in Chem. Abstr., 1953, vol. 47, 10205). The tar gives, on distillation with steam above 270°C, 30 to 40% of a paraffin fraction which could be used as a softener in the rubber industry. The raw paraffin fraction was dissolved in ten times the amount of acetone, frozen out at -15°, and pressed; 25% raw brown paraffin, melting at 46° and 65-67° viscous oil were obtained. The raw paraffin, on treatment with petroleum ether and sulphuric acid, gave a yellowish product. Adding active carbon gave a white product melting at 45°, which could be used in the match industry. The viscous oil on refining with caustic soda and sulphuric acid gave a dark oil corresponding to light spindle oil. C.A.

2070. REFINING OF DISTILLATES OF CARBOLEIC TAR, Braks, N. and Skala, V. (Latv. PSR Zinat. Akad., Kim. Inst. Zinat., (Latv. Zinat. Akad. Inst. Khim. Sci.), 1950, vol. 1, 138-154; abstr. in Chem. Abstr., 1951, vol. 47, 10205). The tar contains 22.5% moisture and the dry tar contains 17.5% phenols, 7.6% pyridine bases, and 60.2% neutral oils. The neutral oils could be used as fuel and lubricant. Three fractions were obtained from the dry tar by fractional distillation: (1) 17.8% boiling below 200°C with 8.8% (vol.) phenols and 8.0% pyridine bases; (2) 27.8% boiling between 200 and 270°C with 22.6 phenols and 9.0% pyridine bases; (3) 31.0% boiling above 270°C and the rest 13.6%. Phenols in (1) and (2) could be separated by means of a 15% aqueous solution of caustic soda or milk of lime (1:100). For separation of pyridine bases, 10% sulphuric acid solution was used. Experiments were also made on the separation of phenols and pyridine bases by means of ethyl alcohol.

TITLE: Study of diffusion and self diffusion in solids with alpha and beta radioactive isotopes 19 7

CITED SOURCE: Uch. zap. Mordovsk. un-t, no. 18, 1961, 39-44

TOPIC TAGS: diffusion in solids, self diffusion in solids, radioactive tracing, alpha active isotope, beta active isotope, scintillation counting

TRANSLATION: Unlike the existing method of determining the concentrations of alpha-active isotopes and the diffusion coefficient with the aid of thick-emulsion photographic plates, a method has been developed for the determination of the diffusion coefficients with the aid of alpha and beta active isotopes, using the scintillation counting method. Owing to the high coefficient of absorption of the radioactive radiation, the thickness of each layer in which the concentration of the diffusing substance is investigated does not exceed the radiation range. The

Card 1/2

L 16192-63

ACCESSION NR: AR3005162

latter circumstance makes it possible to determine directly the concentration of radioactive substance in the layer without introducing corrections for the radiation from the deeper lying layers. A. Khachaturyan.

"A Contribution to the Etiology of Non-gonococcal Urethritis."

Belgrade, Medicinski Glasnik, Vol 17, No 5, May 1963, pp 201-205.

Abstract: [Authors' Serbocroatian summary modified] The authors discuss the forms and causes of the disease and conclude that their research has shown that there have recently been more and more cases of non-gonococcal urethritis and fewer cases of gonorrheal inflammation of the urethra, that cases of trichomonas urethritis are rare (3.6 percent) in that the diagnosis of Trichomonas vaginalis is rather difficult in males, and that Staphylococcus albus cannot be considered a cause of urethritis in view of the fact that it is the most common bacterium found in both in healthy persons and in those suffering from the disease in question. Three tables, 9 Western and Yugoslav references.

"A Contribution to the Proper Interpretation of Serological Reactions."

Belgrade, Narodno Zdravlje, Vol 19, No 9, 1963, pp 301-303.

Abstract: The article traces the history of the application of serological reactions to tests for venereal disease and points out that the classical serological reactions are not strictly specific and may be positive with certain other diseases. A correct interpretation of serological reactions is especially important to proper diagnosis if such reactions are positive in a patient in which the primary effect appears not to be present, if a recent case of syphilis is involved (serological reactions may long be negative, especially if several injections of penicillin have been administered), and if only flocculation reactions are suspicious.

Five Western and two Yugoslav references of recent date.

"Considerations Regarding Current Therapy of Gonorrhea"

Belgrade, Srpski Arhiv za Celokupno Lekarstvo, Vol 94, No 4, Apr 66; pp 363-367

Abstract: German summary modified? Among 32 patients with clinical resistance of gonorrhea to streptomycin, 11 strains of gonococcus were isolated: all were resistant to streptomycin, oxytetracycline, 7 to penicillin and 9 to tetracycline, all were sensitive to triacetyloleandomycin and chloramphenicol. The 32 were among 130 patients with gonorrhea, the rest responded to streptomycin treatment; the 32 responded to chloramphenicol. 2 tables, 1 Soviet, 1 Yugoslav, 8 Western references. Translation from: Referativnyy zhurnal, Metallurgiya, 1958, Nr 4, p 10 (USSR)

AUTHOR: Skepner, Ye. B.

TITLE: Oxidized Copper Ore Flotation (Flotatsiya mednoy okislennoy rudy)

PERIODICAL: Sb. nauchn. tr. Gos. n.-i. in-t tsvetn. met., 1957, Nr 13, pp 50-57

ABSTRACT: A study was made of the flotation of two samples of oxidized Cu ore, consisting chiefly of malachite. When these ores were ground to 50-55 percent -0.074 mm and the following amounts of reagents were used (in kg/t): 0.27-0.21 cresyl frother, 1.5-0.5  $\text{Na}_2\text{S}$ , 0.045 pine oil or terpeneol; concentrates containing 27.3 and 17.5 percent Cu were obtained for the two specimens, respectively, and 80.3 and 72.2 percent of the Cu was extracted. It should be noted that the recovery of this amount of Cu in the concentrates agrees with the figure for cyanide extraction of Cu. In other words, results of a competent analysis of such ores make it possible to predict the amount of flotation extraction without running flotation experiments. It was also established that if the  $\text{Na}_2\text{S}$  is added repeatedly in the course of the flotation

Card 1/2

137-58-4-6398

Oxidized Copper Ore Flotation

a greater flotation speed and greater extraction of Cu in the concentrates is obtained than if  $\text{Na}_2\text{S}$  is added all at once. Addition of the cresyl frother to the mill (prior to  $\text{Na}_2\text{S}$  addition) makes it possible to attain a greater extraction of Cu than when the same amount of frothing agent goes into the flotation chamber after the introduction of  $\text{Na}_2\text{S}$ . The kinetics of flotation of both specimens are well described by a second-order equation in the form suggested by S. I. Mitrofanov. A graph showing the speeds of flotation of both ore specimens is appended.
